### **ACKNOWLEDGEMENTS**

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA Statistical Reporting Service. Shipment and market price data are from the Marketing Bureau Section and USDA's Agricultural Marketing Service. Canned and frozen pack statistics were compiled by the Florida Cannery Association and the National Cannery Association. Where data are from other sources, appropriate footnotes appear.

Records of the Citrus and Vegetable Inspection Division of the Florida Department of Agriculture were employed in production and utilization estimates. The Growers Administrative Committee assisted in developing production estimates.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contribution is sincerely appreciated.

CITRUS SUMMARY

PRODUCTION

Florida's citrus production in 1968-69 was 180,000,000 boxes, approaching the record high level set in 1966-67. The season featured fruit below normal in size and in yield of juice and pounds solids. Fruit droppage of all citrus was light and oranges were the lowest of record.

Hurricane Gladys crossed the upper end of the citrus belt October 18 and 19, causing some grapefruit loss, but had very little effect on State's total crop. A cold wave hit all producing areas December 16 and 17. Damage was most serious in isolated locations between the East Ridge and the West Coast. Actual fruit loss was nominal but fruit quality in cold locations was reduced. Leaf and minor limb damage was common in affected areas. Some young trees were severely damaged by this cold or by a late freeze on February 5.

Final season yield of 45° Brix concentrate was 1.13 gallons FCOJ per box, down 16 percent from the 1.35 gallons per box from the 1967-68 orange crop. Season pack of FCOJ was 103,750,000 gallons, up sharply from 83,697,000 gallons packed in 1967-68. This was much less than the record pack of 131,755,000 gallons in 1966-67, when both boxes harvested and yield were greater. In 1968-69, processors used 90 percent of the round orange crop and 65 percent of the grapefruit.

The objective fruit survey indicated that the Upper Interior counties, (Lake, Orange, Osceola, Seminole and Volusia) had nearly as large a crop as during the record year of 1966-67. This was also true of the West Coast counties, which again harvested a good crop. Averages of fruit per tree for the East Coast were below those counted in 1967-68 and Lower Interior counties remained about the same as the previous year.

Citrus groves were in good condition in the spring of 1969, but flushed and bloomed later than normal. Growing conditions continued to be excellent throughout the spring and early summer with sufficient moisture in most areas.

California's 1968-69 orange crop of 43,600,000 boxes is the largest crop since the early 1950's and more than double the 1967-68 crop.

Temperatures were below normal for the entire month of December with lowest reading occurring December 19 through 22. However, most groves were heated and fruit damage was not too severe. This was followed by record amounts of rainfall during both January and February. Excess moisture caused some erosion damage and fruit loss, but mostly just slowed harvest. Percentage of Navel to processors during that time was heavier than normal. Final harvest of Valencias saw the largest percentage utilized for processing in history of California. Frost damage contributed to the diversion of 48 percent of the crop. The grapefruit and lemon crops in California continued relatively stable. Bloom for the 1969-70 crop peaked in mid-April, about two weeks later than normal.

Arizona's citrus crop shows a gradual increase in volume as new acreage comes into production. The 1968-69 harvest was 11,570,000 boxes, up slightly from the previous crop. Bad weather that hurt California's citrus crop did not adversely affect Arizona and the added rainfall was beneficial. In the spring, groves were in good condition and had a heavy flush of new growth. Bloom was heavy indicating good prospects for the 1969-70 season.

Texas harvested 11,200,000 boxes during 1968-69, it's largest citrus crop since the successive freezes of 20 years ago. The 4,500,000 boxes of oranges was a near record volume, about half going to the processing plants. Groves are in good condition and with renewed interest in new acreage, particularly early oranges. Production is expected to show a modest increase for the next few years.

BEARING ACREAGE IN FLORIDA

In 1968-69 there were 763,914 acres of producing citrus, 4 years old and older, in Florida's commercial citrus groves. Of this, 601,623 acres or 78.8 percent, are oranges. There are 309,161 acres or 51.5 percent early and midseason varieties and 290,986 acres or 48.5 percent, Valencia oranges. Grapefruit constitute the next largest segment with 91,178 acres, 11.9 percent of the bearing commercial citrus acreage.

Specialty varieties make up 7.5 percent of the bearing acreage. Temples have 19,858 acres, Tangelos 13,359 acres, Tangerines 16,231 and Murcotts have 8,160 acres. Acid and miscellaneous varieties make up the remaining 13,505 acres.

AERIAL PHOTOGRAPHY

Aerial photography is utilized to survey Florida's commercial citrus inventory. A reflight to update inventories as of December 1969 is underway. The photos will be interpreted using stereoscopes, then ground checked for change in grove character. New plantings will be enumerated and abandoned and pushed out acreage removed. A summary will be published in mid-1970.

PRICES

On-tree prices for oranges during the 1968-69 season remained about the same as the previous season. The box level increased sharply, but yield was so low that total packout at processing plants was much lower than had been expected. Grapefruit growers had a sharp price drop from the relatively good on-tree prices received in 1967-68. Grapefruit production during 1968-69 was at a level close to the large crop harvested in 1966-67.

The total value of sales in 1968-69 was \$302,833,000, almost identical to the 1967-68 value. The preliminary crop value for 1967-68 has been revised.

VALUE

Florida, All Citrus: Value of Sale, On-Tree Crop Years 1959-60 through 1968-69

Year	Value	Year	Value
1959-60	\$ 220,021,000	1964-65	\$ 270,804,000
1960-61	296,516,000	1965-66	222,027,000
1961-62	247,348,000	1966-67	175,457,000
1962-63	247,793,000	1967-68	302,768,000
1963-64	332,063,000	1968-69	302,833,000

Note - Net contents of box varies. The Florida citrus code defines an equivalent standard box of fruit as 90 pounds for oranges and Tangelos, 85 pounds for grapefruit, 95 pounds for Tangerines, and 80 pounds for Limes. These weights have been used in these statistics for Florida. Texas average weights are 90 pounds for oranges and 80 pounds for grapefruit. California and Arizona use a smaller box. California weight averages are: oranges, 75 pounds; grapefruit, 65 pounds and lemons, 76 pounds. Arizona average weights are: oranges, 75 pounds; grapefruit, 64 pounds; lemons, 76 pounds.

HISTORY OF FLORIDA'S CITRUS INDUSTRY

The citrus tree is a native of the Orient from which it was carried ever westward. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were growing in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the State. The oldest cultivated grove planted in Florida (Hume, 1926, p. 95) is thought to be the Don Phillippe grove in Pinellas County, planted some time between 1809 and 1820. The site is now the Don Phillippe Park and is just north of Safety Harbor.

Citrus production in Florida had reached the all time high to near 6 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It took fourteen years to reach this level of production again. Since the late forties Florida has produced more than half the Nation's citrus fruit supply. Florida surpassed all other States in bearing citrus acreage in 1932-33 with 265,400 acres, which accounted for 46 percent of the United States total bearing acreage. By the mid-sixties Florida had approximately two-thirds of the Nation's bearing citrus acreage.

Table 52 -- Other States' Citrus: Acreage By States, Types and Age Groups

ARIZONA <sup>1/</sup>									
Age Group	Navel and Sweet Oranges	Valencia Oranges	White Grapefruit	Red Grapefruit	Lemons	Limes	Tangelos	Tangerines	All Citrus
